

FLOVIL FLOCCULANT

FLOVIL is the ideal solution for removing turbidity from swimming pool water by grouping colloidal particles into larger ones that are easily retained by the filters or decanted to the bottom for removal, also reducing the consumption of disinfectants.

CHARACTERISTICS

- FLOVIL groups microscopic particles suspended in the water by electrostatic attraction, facilitating filtration and reducing the time of this process by up to 50%.
- Compatible with all types of treatments and filters (sand, cartridge, diatomaceous earth), leaves the water crystal clear in a few hours..
- Odorless and unobtrusive for bathers, replacing other liquid, powder or sachet flocculants..

INSTRUCTIONS

Put the pellet (s) in the skimmer basket or compensation cup. The tablet comes into contact with water, dissolves slowly for a few days and acts in small doses. After the filtration of the precipitates in suspension the water becomes clear and crystalline.

- Maintenance: 1 tablet per week for pools up to 60 m³*.
- Shock treatment: (after the winter season, heavy rains, significant influx of bathers or in case of cloudy water), add to the water 3 tablets spread over its surface.

* Recommended dose per 60 m³
